## USB 2.0

USB 2.0 is a standard for connecting devices to a computer. It is a type of USB that can transfer data at a rate of up to 480 Mbps. It is commonly used for connecting devices such as keyboards, mice, and external hard drives. The standard was developed by Intel, Compaq, and Hewlett-Packard in 2000. It is a subset of the USB 1.1 standard, which was developed in 1996. The USB 2.0 standard is backward compatible with USB 1.1 devices. It is also compatible with the USB 3.0 standard, which was developed in 2008. The USB 3.0 standard is a superset of the USB 2.0 standard, meaning that it can support all the devices that USB 2.0 can support, as well as devices that require the higher data transfer rates of USB 3.0. The USB 3.0 standard is also backward compatible with USB 2.0 devices. The USB 3.0 standard is currently the most common type of USB used for connecting devices to a computer. It is also the most widely supported type of USB. The USB 3.0 standard is supported by most operating systems, including Windows, macOS, and Linux. It is also supported by most hardware manufacturers, including Intel, AMD, and NVIDIA. The USB 3.0 standard is a significant improvement over the USB 2.0 standard, and it is expected to continue to be widely used for many years to come.
